Phase 5: Deployment, Documentation & Maintenance

This phase validates that the SwiftShip Tracker agent, created using Salesforce Agentforce Builder, works as intended within the Salesforce Developer Org environment, and describes how the solution is documented and maintained.

1. Deployment

The agent was built and tested in a Salesforce Developer Org. Version 1 of the agent was committed, creating a fixed snapshot of the agent, and then activated. Agentforce Builder confirmed the activation with the message “Agent SwiftShip Tracker Version 1 is activated.”

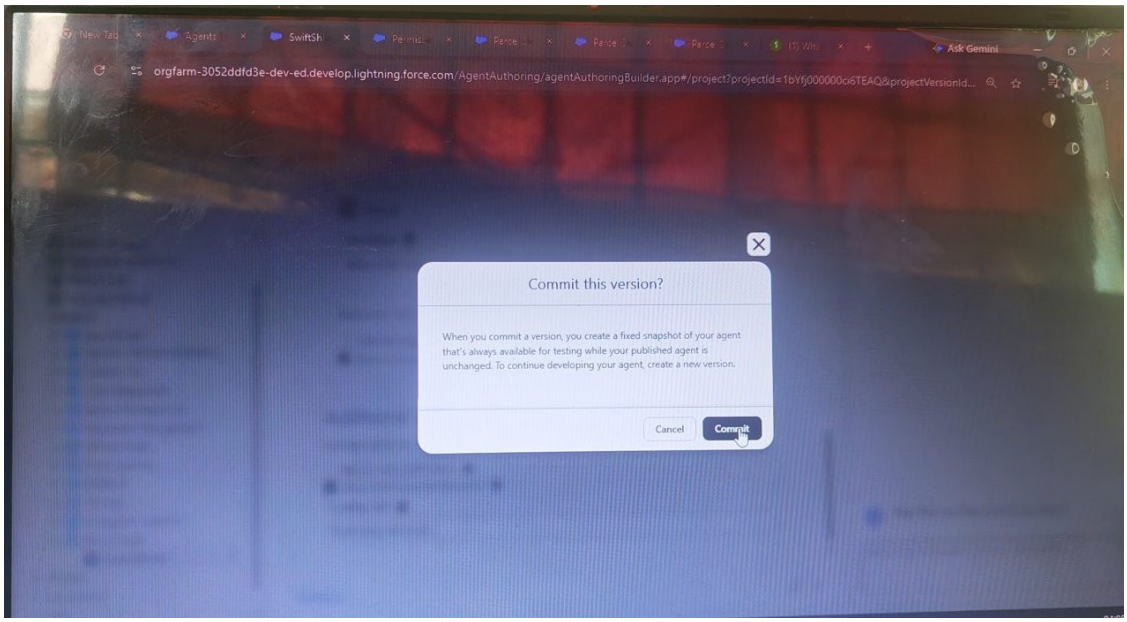

Figure 1: Committing Version 1 of the agent

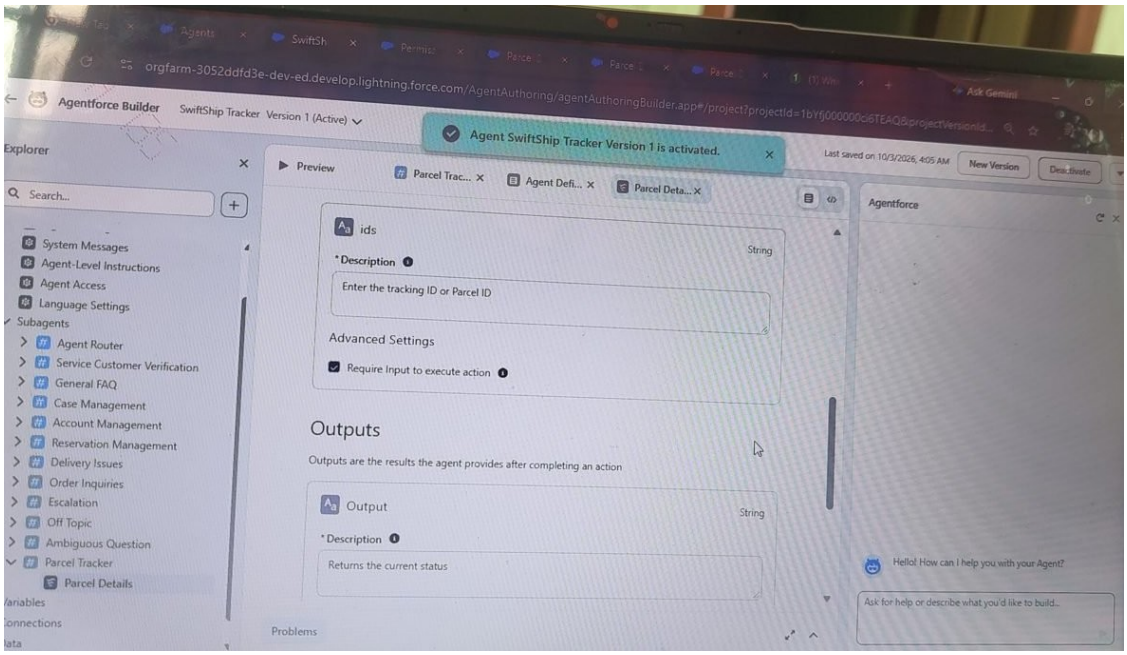

Figure 2: Activation confirmation in Agentforce Builder

The deployed solution includes:

- **Custom objects:** Parcel, Delivery, Sender, and Receiver
- **Prompt template:** “Retrieve Parcel Details” (Prompt Builder)
- **Flow:** Parcel Details (auto-launched Flow)
- **Subagent:** Parcel Details Inquiry, with the Parcel Details action
- **Permission set:** Swift Ship, assigned to the EinsteinServiceAgent User

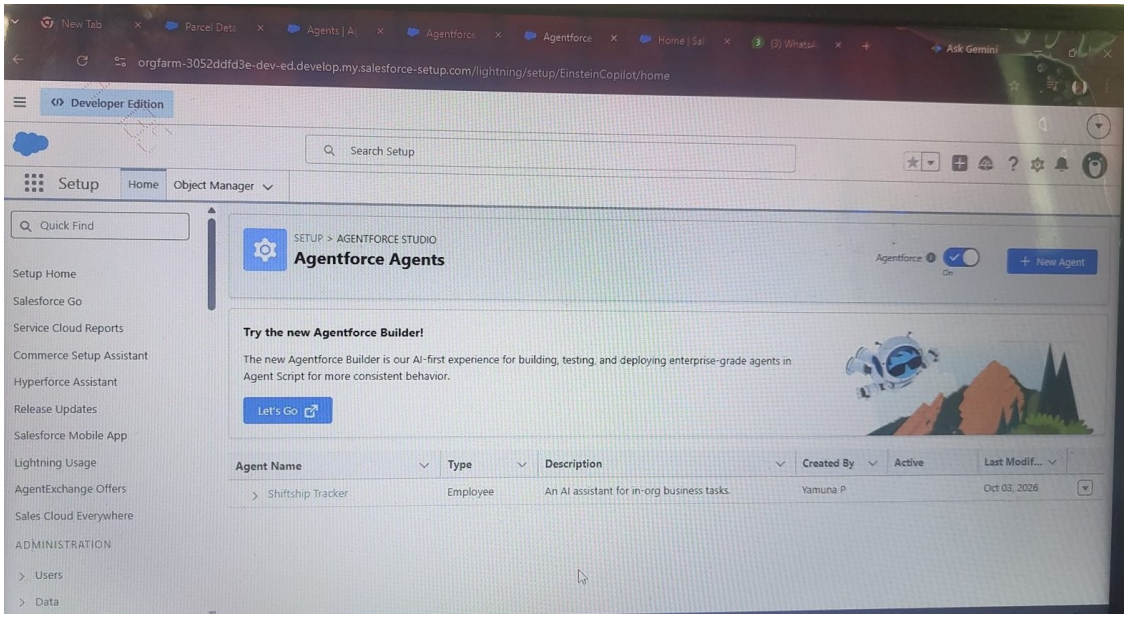

Figure 3: SwiftShip Tracker agent listed in Agentforce Agents

2. Testing in the Developer Org

Testing was conducted within the Developer Org to simulate how the agent would perform in a live setup. The main goal was to confirm correct topic recognition, Flow execution, and data retrieval from the Salesforce custom objects, and that permissions and interactions function correctly.

A test Parcel record (Parcel ID P-001, Status: Booked, Weight: 2, Estimated Delivery: 10/29/2026) was created, and the agent was asked for its details.

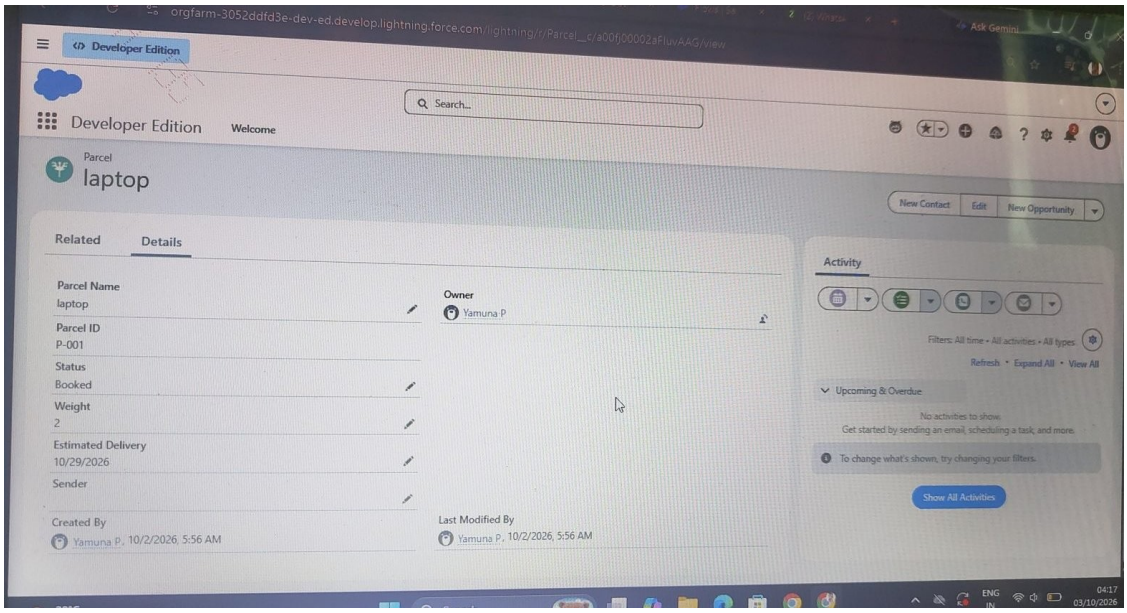

Figure 4: Test Parcel record P-001 in Salesforce

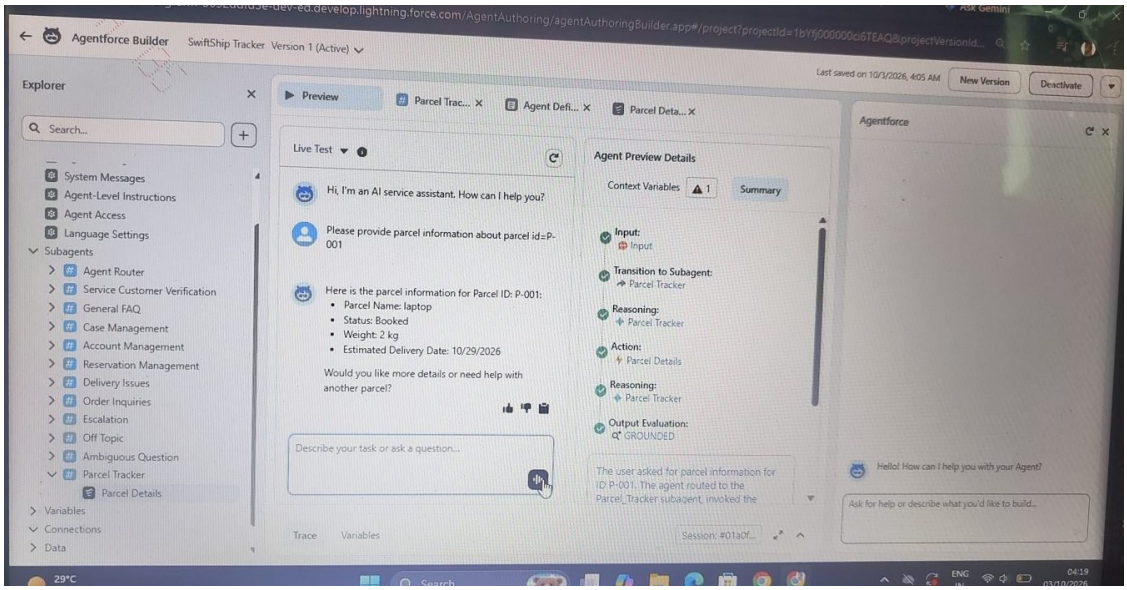

Figure 5: Agent response and reasoning trace in the Live Test

The agent returned the same values stored in the record (laptop, Booked, 2 kg, 10/29/2026). The trace shows the request was routed to the Parcel Tracker subagent, the Parcel Details action ran, and the output was evaluated as GROUNDED.

3. Scope of Testing

Real-world production testing (UAT or sandbox deployment) was not performed in this project because:

- Developer Edition orgs are standalone environments and do not support production-linked testing environments.
- Enterprise-level Agentforce deployment involves sandbox testing, staging environments, and CI/CD automation, which are outside the scope of this academic/prototype implementation.

4. Documentation

The project is documented in this report, which covers:

- **Planning and design:** problem statement, empathy map, requirements, data flow, and solution architecture.
- **Project management:** sprint backlog and schedule.
- **Build guide:** step-by-step instructions for creating objects, tabs, fields, the prompt template, the Flow, the permission set, and the agent.
- **Testing evidence:** screenshots of verification and live testing.

5. Maintenance, Monitoring & Troubleshooting

Ongoing maintenance ensures that Parcel, Sender, Receiver, and Delivery data remain accurate, synchronized, and up to date. Regular monitoring helps detect:

- misrouted agent queries
- failed Flow executions
- performance delays in Agentforce responses

Troubleshooting activities include:

- resolving configuration and permission errors
- updating Flow logic
- refining subagent descriptions and scope
- improving prompts to enhance user interactions

Although this project is implemented in a Developer Org for learning purposes, these practices are essential in real-world enterprise deployments. They keep AI-powered service agents reliable, scalable, and aligned with evolving customer service operations and business goals.

7. Functional & Performance Testing

During testing, screenshots were captured from Salesforce to validate agent setup, subagent configuration, Flow execution, permission assignment, data retrieval, and the agent's live responses. All features were verified for correct functionality.

No.	Feature tested	Result observed	Status
1	Agent listed and active	SwiftShip Tracker agent appears in Agentforce Agents (Version 1 active)	Pass

2	Subagent configuration	Parcel Details Inquiry has the correct description, scope, and linked Parcel Details action	Pass
3	Flow	Parcel Details flow is Active: Get Parcel Records → prompt action → output	Pass
4	Permissions	Swift Ship permission set assigned to EinsteinServiceAgent User (Success)	Pass
5	Agent activation	Version committed; activation confirmation shown	Pass
6	Data retrieval	Prompt for P-001 returned laptop, Booked, 2 kg, 10/29/2026, matching the record	Pass
7	Topic routing and grounding	Request routed to Parcel Tracker subagent; output evaluated as GROUNDED	Pass

Performance: the agent returned the parcel details in the Live Test without errors or retries, and the response was grounded in the Salesforce record. Detailed response-time measurements were not recorded in this prototype.

8. Advantages & Disadvantages

Advantages

- Centralized parcel and customer information in Salesforce.
- Better visibility into parcel booking and delivery tracking.
- Automates key logistics processes using Salesforce Flow.
- Agentforce enables conversational customer support and parcel-status assistance.
- Prompt Builder supports AI-powered responses and self-service.
- Reduces manual effort for customers, support teams, and administrators.
- Provides timely notifications and updates during the delivery process.
- Experience Cloud can give customers convenient access to tracking information.
- Supports integration with external logistics systems.
- Can scale to support multiple locations and growing parcel operations.

Disadvantages

- Requires accurate and up-to-date parcel and customer data.
- Depends on Salesforce configuration and automation.
- Agentforce responses depend on properly configured prompts and available data.
- External logistics integrations may increase implementation complexity.
- Flow and automation logic require regular maintenance when business processes change.
- Users need appropriate Salesforce or Experience Cloud access to use the system.
- Initial Salesforce implementation and configuration can require significant effort.

- Expanding to additional locations or integrations may require further customization.

9. Conclusion

The SwiftShip Tracker demonstrates how Salesforce can be used to build a centralized parcel management and tracking solution. The project integrates custom objects, relationships, Flows, Apex, Email Alerts, Experience Cloud, Agentforce AI, Prompt Builder, security controls, and reporting to support parcel booking, delivery tracking, status updates, and customer communication.

The integration of Agentforce AI with Prompt Builder and Salesforce Flow provides a conversational approach to parcel tracking, enabling customers to obtain shipment information without depending entirely on manual support. The project therefore provides a practical foundation for a scalable and user-friendly parcel management solution.

10. Future Scope

- Extend Agentforce capabilities for more parcel-management queries.
- Enhance real-time delivery tracking.
- Expand customer self-service through Experience Cloud.
- Add more advanced delivery-performance analytics.
- Integrate additional external logistics systems.
- Improve AI prompts and conversational experiences.
- Introduce enterprise-level sandbox and CI/CD deployment.
- Expand automation for additional parcel operations.

11. Appendix

- **A. Custom Objects:** Parcel, Delivery, Sender, Receiver
- **B. Standard Objects:** Account, Contact, Case, Task, EmailMessage, User
- **C. Automation:** Flows, Approval Processes, Email Alerts
- **D. Apex:** Apex Classes, Batch Apex
- **E. AI:** Agentforce AI, Prompt Builder
- **F. UI:** Lightning App, Lightning Record Pages, Experience Cloud
- **G. Security:** Profiles, Roles, Permission Sets, Sharing Rules, Field-Level Security
- **H. Analytics:** Reports & Dashboards
- **I. Testing:** Flow, Agentforce, data retrieval, security and permission validation

Thank You
